OPERATING MANUAL

GoldScalperNinja · version 3.1

Stop orders that chase price | Two-phase pruning | Trend Master D1

Lot–Price distance filter | Neon control panel | Remote control from your phone

A good automated system is not one that never loses.
It is one that loses only in the way you planned for.

YOUR GUIDE ON THIS JOURNEY

Hi, I'm the Gold Scalper Ninja

I will walk beside you for the next 30 pages. This manual is written as a **lesson**, not a lookup table: every setting is explained by *why it exists* before we talk about *what value to use*. Every setting is called by the exact English label you see in the EA's settings window (press `F7` on the chart).

I	**How the Ninja trades**	03
	Lesson 1 · The life of one trading cycle	04
	Lesson 2 · Three numbers that decide survival	05
	Lesson 3 · Installation & license	06
	Weapon 1 · Stop orders that chase price	07
	Weapon 2 · Two-phase pruning	08
	Weapon 3 · Trend Master D1	09
	Weapons 4 & 5 · Distance filter & safety brakes	10
II	**The Neon control panel**	11
	Reading every zone of the panel	12
	Eight buttons & on-chart signals	13

SYMBOLS USED IN THIS MANUAL

✓ **Recommended**
A safe choice that suits newcomers.

★ **Pro tip**
Experience gathered from real accounts.

i **Explanation**
Background knowledge — why a setting exists.

! **Warning**
Where accounts get lost. Please read carefully.

How to read the setting tables

Each table has three columns: the **label shown in the settings window**, a **plain-language explanation**, and the **default value** printed in red. Only settings you can actually see and change are covered. Prices are explained in **points** — on most brokers gold is quoted with two decimals, so **100 points = 1.00 USD** of gold price (for example 3,350.00 → 3,351.00).

ONLY HAVE TEN MINUTES?

05
Three numbers that decide survival
Depth, total lot and breakeven — the math behind every grid.

06
Installation & license
Ten minutes from download to a running, licensed EA.

10
The safety brakes
The five layers that stop a bad day from becoming a lost account.

26
Starting configurations
Three tested starting points to observe on a Demo account.

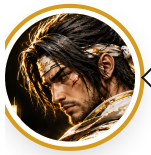

PART ONE

How the Ninja trades

GoldScalperNinja was not built to promise fast riches. It was built to solve three real pains of grid trading on gold: entries fired too early into a running market, chains of trapped orders that never come home, and a one-way move that grinds an account down while you sleep.

PART · I

In one sentence: the EA keeps one stop order on each side that **follows price**. When price turns, the order fills and a chain begins. If price keeps moving against that chain, the EA adds orders at controlled distances with a controlled lot ladder — and closes the **whole basket** as soon as the combined BUY + SELL profit reaches your target.

BEFORE YOU READ ON, REMEMBER ONE THING

The risk of a grid system does not live in any single order — it lives in the **whole chain**. A chain of 30 orders with an uncontrolled lot ladder can end up hundreds of times larger than its first order. Every page of this manual teaches one skill: **keeping that chain inside the limits you chose.**

THE FIVE WEAPONS OF VERSION 3.1

01
Stop orders that chase price

The EA never buys into a falling knife. Its Buy Stop trails price down and only fills when price turns back up — and the mirror image for Sell Stop.

02
Two-phase pruning

Winning orders are closed first. Only then are the oldest losers cut — never more than the banked profit can pay for.

03
Trend Master D1

Reads the daily candle, draws a band around today's open and decides whether BUY, SELL or both are allowed.

04
Lot-Price distance filter `NEW v3.1`

A bigger lot must always sit at a better price than every smaller order of its side. Oversized orders at bad prices and duplicate orders at the same level are stopped before they reach the broker.

05
Neon panel & remote control

Account health, both chains, filters and license on one animated panel — plus switching the EA off or on from your phone with a single pending order.

Built for you if...

you accept a floating minus as part of the process, can keep the EA running 24/7, and are willing to set your brakes before the first trade.

Not built for you if...

you want "set and forget" without limits, plan to run large lots on a small account, or cannot look at a red number calmly.

! Please read before installing

This is a **multi-order system with growing lot sizes**. Its mechanics let it ride through normal swings, but a strong one-way move can stretch the chain — and its total lot — very quickly. So: **always run it on Demo first**, always set a **daily profit target** and a **daily max loss**, and never trade money you cannot afford to lose.

LESSON 1

The life of one trading cycle

Everything the EA does revolves around the **cycle**. A cycle starts with a first stop order and ends when the whole basket is closed. The BUY side and the SELL side each run their own chain at the same time; the profit target is measured on **both chains combined**. Understand the six steps below and you understand most of how the Ninja works.

STEP 1 **Gate check** schedule, news, limits, Cycle → STEP 2 **First stop order** placed a short step away → STEP 3 **Chase price** the order follows until price turns → STEP 4 **Chain grows** new orders at controlled steps → STEP 5 **Prune** winners pay off old losers → STEP 6 **Close basket** target hit, new cycle

STEP	WHAT THE EA IS DOING	SETTINGS THAT CONTROL THIS STEP
1 · Gate check	Checks the trading schedule, news filter, daily limits, Cycle state, license and which directions are allowed. A new chain starts only when every gate is open.	Trading schedule · News filter · Daily limits · Trade direction mode
2 · First stop order	On each side that is allowed, places a Buy Stop just above price or a Sell Stop just below it, *First grid step* away, with the *Initial lot size*.	Entry mode · First grid step · Initial lot size
3 · Chase price	If price runs away from a stop order, the order follows it — a Buy Stop only ever moves **down**, a Sell Stop only **up**. It fills only when price turns back — the EA joins a move instead of catching a falling knife.	Trail pending orders by price
4 · Chain grows	If price moves against an open chain, the next order is allowed only at least one *Grid step* beyond the worst order of that side. Its lot comes from the lot ladder and must pass the distance filter.	Grid step · Minimum distance · Lot settings · Distance filter
5 · Prune	Once the grid is large, profitable orders pay for closing the oldest losing ones — profit first, loss second — always keeping a small profit.	Enable sequence pruning · Enable cross-side pruning
6 · Close basket	When BUY + SELL floating profit reaches *Chain take profit*, every position and pending order is closed. If CYCLE is ON, step 1 starts again immediately.	Chain take profit · CYCLE button · Daily limits

i The EA closes the basket, not single orders

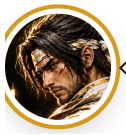

One order showing −$30 does not mean you are losing. If the BUY and SELL chains together are positive, the EA closes everything and you finish in profit. Train your eye on **FLOATING P/L** on the panel, not on single lines in the Trade tab.

✓ The most important button is CYCLE

CYCLE: OFF does not close anything. It tells the EA: "finish the chains you have, but do not start new ones." Open chains are still managed and can still add orders to reach the target. It is the softest way to land the EA without cutting a single loss.

! A cycle can live for a long time

Nothing guarantees a cycle ends within the day. If gold runs one way, a cycle can last several days while the chain keeps growing. That is exactly why **Daily limits** exist (page 22): they are what forces the EA to stop when you are not watching.

A NINJA'S WAY TO PICTURE IT

The first order is the **scout**, averaging orders are **reinforcements**, pruning **carries out the wounded**, the basket close is **mission complete**.

LESSON 2

Three numbers that decide survival

Out of all the settings, only three numbers truly decide whether an account lives or dies. If you only have ten minutes for this manual, read this page.

A
Depth of tolerance

About **number of orders × Grid step**. This is how far price can travel against a chain while the EA still has room to add orders. With the default step of 50 points, 30 orders cover only about **1,500 points ≈ 15 USD** of gold price.

B
Total open lot

The volume you hold if the chain fills deep. With the default lot ladder (0.01, ×1.5 every 2 orders) one side reaches **2.26 lots after 20 orders** and **17.50 lots after 30**. On a standard 100-oz contract, every 1 USD gold move is then worth about **1,750 USD**.

C
Basket breakeven

The price at which the chain's total profit is zero. Each new, larger order drags breakeven closer to the current price — that is how a chain recovers. But the deeper the chain, the more money is at stake while it waits.

EXAMPLE IN NUMBERS · GOLD QUOTED WITH TWO DECIMALS

GRID STEP YOU SET	DEPTH · 20 ORDERS	DEPTH · 30 ORDERS	IN GOLD PRICE (30)	CHARACTER
50 points · default	1,000 pt	1,500 pt	≈ 15 USD	Very dense: fast, small targets, needs strong brakes
100 points	2,000 pt	3,000 pt	≈ 30 USD	Dense: active accounts with room to breathe
200 points	4,000 pt	6,000 pt	≈ 60 USD	Balanced for medium accounts
300 points	6,000 pt	9,000 pt	≈ 90 USD	Wide: slower targets, deep tolerance

Depth is approximate and counts the minimum spacing. *Grid step after MaxTrade* can widen the deeper part of the chain — for example 100 points for the first 8 orders and 200 points afterwards gives about 5,200 points for 30 orders.

THE DEFAULT LOT LADDER, ORDER BY ORDER · 0.01 START · ×1.5 EVERY 2 ORDERS

ORDER #	1	2	3	4	6	8	10	12	15	20	25	30
Lot of that order	0.01	0.01	0.02	0.02	0.02	0.03	0.05	0.08	0.17	0.38	1.30	2.92
Total lot open	0.01	0.02	0.04	0.06	0.10	0.16	0.26	0.42	0.81	2.26	6.46	17.50

Lots are rounded to your broker's volume step, so tiny ±0.01 differences are possible. Pruning normally keeps chains far shorter than this — but the ladder is what you are exposed to if pruning cannot keep up.

i What is a "point" and why it appears everywhere

A point is the smallest price step your broker quotes. For gold quoted with two decimals, **100 points = 1.00 USD** of price — the move from 3,350.00 to 3,351.00. So a *Grid step* of 50 means the EA adds the next order after price moves about 0.50 USD further against the chain. Some brokers quote gold with three decimals; then 1,000 points = 1.00 USD. Check the number of decimals on your chart before you calculate.

✓ Homework before you press start

Take your depth of tolerance and compare it with a strong week of gold. Gold has weeks that move **more than 100 USD in one direction**. If your depth is 30 USD, accept that this configuration will one day meet such a week — and have your brakes (page 10) ready before it happens.

★ The number that matters more than profit on Demo

Do not write down "this week made X". Write down the **deepest floating loss** the Demo account ever touched. That number tells you how much capital this configuration needs to breathe. If the deepest point on Demo equals half of your real account, the configuration is not ready.

LESSON 3

Installation & license in ten minutes

Do these seven steps once, in this order. Most “the EA does nothing” messages we receive come from skipping step 2 or step 5.

1. **Copy the file**
   In MetaTrader 5: *File → Open Data Folder → MQL5 → Experts*. Paste `GoldScalperNinja EA v3.1.ex5`, then right-click *Expert Advisors* in the Navigator and choose *Refresh*.

2. **Allow the license server**
   Tools → Options → Expert Advisors: tick *Allow WebRequest for listed URL* and add two lines:
   `https://script.google.com`
   `https://script.googleusercontent.com`

3. **Open an XAUUSD chart**
   Any timeframe works. One chart runs one EA with one *Magic* number.

4. **Attach the EA**
   Drag it from the Navigator onto the chart. In the *Common* tab tick *Allow Algo Trading*; in the *Inputs* tab enter your settings (Part III). Press OK.

5. **Switch on Algo Trading**
   The *Algo Trading* button on the toolbar must be green. When the EA starts it also tidies the chart: grid, volumes and trade history are hidden.

6. **Check the panel**
   The *License* row should turn `ACTIVE`. The *ID* row shows your account number — this is the number you send to support for activation.

7. **Keep it running 24/7**
   A VPS close to your broker's server is strongly recommended — and essential for *Virtual stop* entry mode, whose levels live inside the running EA.

WHAT THE LICENSE ROW ON THE PANEL TELLS YOU

STATUS WORD	MEANING AND WHAT TO DO
`ACTIVE | lifetime` `ACTIVE | exp date`	Licensed. Everything works. When there is an end date, the date is shown on the panel.
`CHECKING...` `VERIFYING...`	The EA is talking to the license server — normal for a few seconds after attaching. New orders wait until it finishes.
`NOT REGISTERED`	This account number is not registered yet. Send the ID shown on the panel to **t.me/GoldScalperNinja**.
`EXPIRED` `REVOKED` `NOT STARTED`	The license period has ended, was withdrawn, or has not begun yet. Contact support.
`NETWORK ERROR` `SERVER BUSY`	Check your internet connection and the two WebRequest addresses of step 2. The EA retries by itself.
`CONFIG ERROR` `TESTER (bypass)`	Configuration problem — contact support. In the Strategy Tester no license check is made.

i No key to type

The license is tied to your **MT5 account number**, so there is no “license key” field in the settings window — that is normal. A message box also pops up once if the status turns to NOT REGISTERED, EXPIRED or REVOKED.

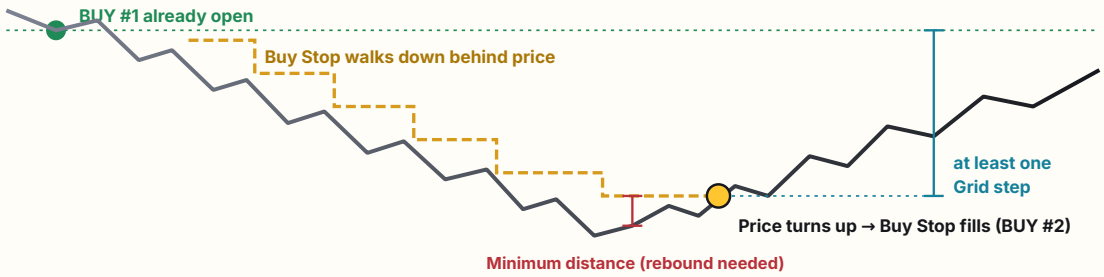

✓ A license problem never abandons your orders

When the license is not active, the EA only refuses to **open new orders**. Positions that are already open keep being managed — pruning, basket take profit and stop loss continue to work.

WEAPON ONE

Stop orders that chase price

A classic grid buys at fixed levels while price is still falling. The Ninja does the opposite: it keeps a **Buy Stop above price** that walks down behind a falling market and only fills when price **turns back up** by the *Minimum distance*. Sell Stops do the mirror image on the way up.

THREE ENTRY MODES · SETTING "ENTRY MODE"

MODE	WHERE THE WAITING ORDER LIVES	STRENGTHS	WATCH OUT FOR
Stop orders `default`	A real Buy Stop / Sell Stop on the broker's server.	Triggers on the server even if your terminal blinks at that moment. The simplest and most transparent mode.	Like any stop order, it can slip a little in a fast spike.
StopLimit orders	A Buy Stop Limit / Sell Stop Limit on the server.	When the stop price is touched, a limit order is placed a few points better — protection against bad fills in spikes.	If price jumps straight through, the order may not fill at all. Not every broker offers stop-limit on gold.
Virtual stop (VPO)	Only inside the running EA — nothing waits on the server.	Your waiting levels are not visible on the broker's side. When price touches a level, the EA sends a market order.	Needs the terminal online 24/7 (VPS). A market order may slip more than a server stop. Levels are rebuilt if the EA restarts.

WORKED EXAMPLE · DEFAULT SETTINGS · GOLD AT 3,350.00

1 A Buy Stop is placed at **3,350.40** — 40 points above price (*First grid step*).

2 Gold slides to 3,346.00. The Buy Stop has walked down behind it and now waits about **0.40–0.80 above** price.

3 Gold bounces. **BUY #1** fills at about 3,346.50 with the *Initial lot size*.

4 Gold falls again. The next Buy Stop may only sit **one Grid step (0.50) below BUY #1** or lower.

5 Gold bounces from 3,343.00: **BUY #2** fills near 3,343.50 with the next lot from the ladder.

✓ Start with Stop orders
It is the most transparent mode and the easiest to follow in the Trade tab. Use it for your whole first month.

i Why stop, not limit?
A limit order buys while price is still falling. A stop order waits for the turn. You give up a little price, but you stop buying the middle of a waterfall.

! Virtual is not invisible
Once a virtual level fires, the position is a normal order at your broker. And if your terminal is offline, a virtual level cannot fire at all.

WEAPON TWO

Two-phase pruning

A long grid is dangerous because of its **oldest orders**: they sit furthest from price with the deepest losses. Pruning uses the profit of other orders to close them early. Each successful pruning pulls the breakeven back toward price and makes the chain shorter — so the basket target becomes reachable again.

THREE WAYS THE NINJA PRUNES

01

Sequence pruning · inside one side

When the grid has grown large, the EA takes the **oldest orders of a side** — normally its deepest losers — and pays them off with the **newest profitable orders of the same side**.

`Enable sequence pruning`

02

Cross-side pruning · one side pays for the other

When Trend Master shows price at the **top or bottom edge** of today's zone, winners of the side that follows the move pay off the **worst loser of the opposite side**.

`Enable cross-side pruning`

03

Trend clean-up · BUY and SELL as one chain

Once a trend is confirmed (the panel shows `[LOCK BUY]` or `[LOCK SELL]`), with-trend winners clear counter-trend losers, starting with the one **furthest from price**.

`runs while sequence pruning is ON`

WHY IT IS CALLED "TWO-PHASE"

PHASE 1
Bank the profit
Winning orders are closed first, and the EA waits for the broker to confirm the money is in the account.

→

PHASE 2
Cut only what is paid for
Losing orders are closed one by one — only while the banked profit still covers them and leaves a minimum profit.

→

RESULT
Net positive, every time
Commission and swap are estimated and included, so a pruning never turns a profit into a hidden loss.

RULES BUILT INTO EVERY PRUNING

- Only **part of the grid** can be closed in one pruning — the chain is never torn down in a single shot.
- Every pruning must leave a **small minimum profit**, plus a buffer for each order it closes.
- A short **cool-down** follows each pruning so the broker is never flooded with requests.
- Pending stop orders are trimmed too, so a large grid does not keep piling up waiting orders.
- None of these rules need a setting — they work automatically when pruning is ON.

i Why profit first, loss second?

If winners and losers are sent together and the winners slip or get rejected, you may have realised the losses without the profit that was meant to pay for them. Two phases make sure the money is **already in the account** before any loss is taken.

ONE PRUNING, IN NUMBERS · ILLUSTRATION

MOMENT	ORDERS CLOSED	MONEY MOVED	BANKED SO FAR	WHAT THE EA DECIDES
Phase 1	3 newest winners	+22.40	+22.40	Profit confirmed by the broker → go on
Phase 2 · loser 1	oldest BUY	-9.80	+12.60	Still covered with a cushion → cut it
Phase 2 · loser 2	next oldest BUY	(-11.90)	+12.60	Would leave too little → keep it for a later pruning
Result	4 orders	–	+12.60	Chain 4 orders shorter, breakeven closer, money still made

✓ Keep both switches ON

Pruning is what keeps chains short. With it switched off, the EA becomes a plain grid that can only leave through the basket take profit or your stop loss.

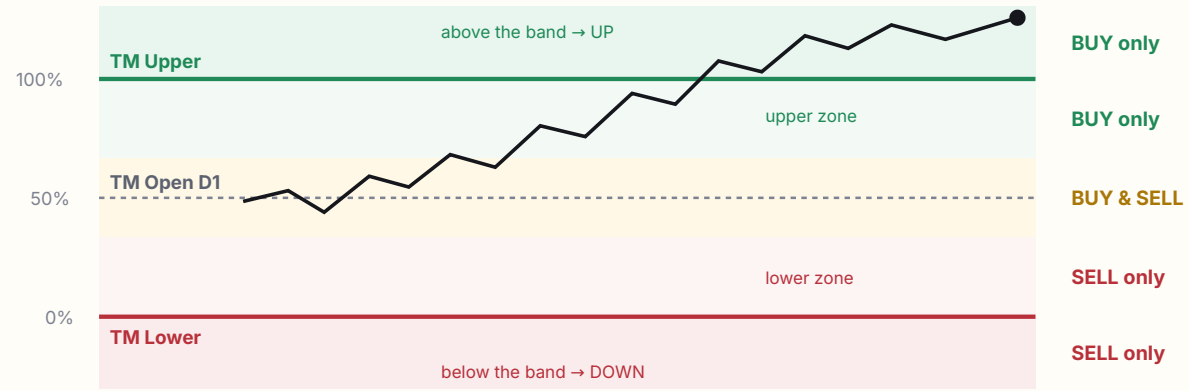

! Pruning is not magic

It needs profitable orders to work with. In a one-way market where every order of a chain is losing, there is nothing to prune with — then only your limits (page 10) protect the account.

WEAPON THREE

Trend Master D1 — the daily compass

At the start of every trading day (broker server time) Trend Master reads the daily chart and draws three lines: **TM Open D1** (today's open), **TM Upper** and **TM Lower**. The width of the band adapts by itself to yesterday's candle and to the average daily range. Where price sits inside this band tells the EA which side may trade.

Green solid line = TM Upper **Dotted line** = TM Open D1 **Red solid line** = TM Lower

The three lines are recalculated once, when the new daily candle opens. They do not move during the day.

WHAT EACH POSITION MEANS · WHEN "TRADE DIRECTION MODE" IS AUTO TREND MASTER

WHERE PRICE IS	PANEL "TREND" SHOWS	WHAT THE EA ALLOWS
Above TM Upper	`UP 100%`	**BUY only.** SELL may not start a chain or add orders.
Upper zone · about the top third	`SW 70%` … `SW 99%`	**BUY only** — the market is leaning up before it breaks out.
Middle of the band	`SW 50%`	**BUY & SELL** both run their own chain.
Lower zone · about the bottom third	`SW 1%` … `SW 30%`	**SELL only** — the market is leaning down.
Below TM Lower	`DOWN 0%`	**SELL only.** BUY may not start a chain or add orders.

"Blocked" never means "closed": orders already open on the blocked side stay open, keep being pruned and are closed together with the basket.

When a trend is confirmed: [LOCK SELL] and [LOCK BUY]

If price stays on one side for a run of ticks, the trend is confirmed and the panel adds **[LOCK SELL]** (uptrend) or **[LOCK BUY]** (downtrend). From that moment the counter-trend side may not add orders, the trend clean-up pruning starts, and the **first order of the new with-trend chain may open with a larger lot** — the next level of the trapped chain — so its profit can help clear the trapped orders faster. The lock lifts when price settles back in the middle of the band, and every new day starts unlocked.

✓ Let the compass work

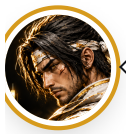

Auto mode is the default for a reason: it stops the EA from fighting a strong daily move from both sides at once.

i In the other modes

With ONLY BUY, ONLY SELL or BUY & SELL the lines are still drawn and still guide cross-side pruning, but they block nothing.

! "NO DATA" on the panel

Trend Master needs a few weeks of daily candles. Open an XAUUSD D1 chart once so MT5 downloads them. Until then no side is blocked.

WHAT THE COMPASS IS — AND IS NOT

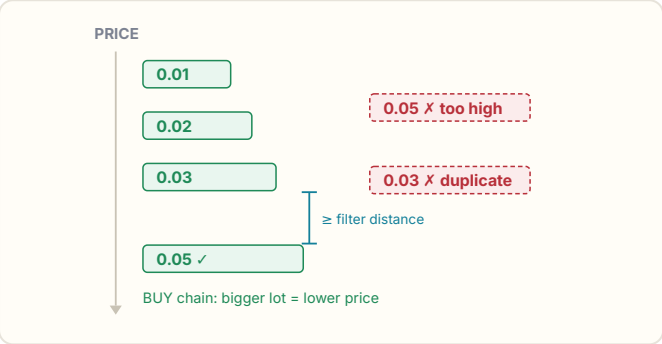

Trend Master does not predict where gold will go. It only stops the EA from **fighting what the daily chart already shows**. That alone removes many of the chains that would otherwise grow too deep.

WEAPONS FOUR & FIVE

The distance filter & the safety brakes

04 · The Lot-Price ladder NEW v3.1

In a healthy chain, every bigger order sits at a **better** price than the smaller ones before it: lower for BUY, higher for SELL. The distance filter checks this **before** any order reaches the broker — and also refuses two orders of the same side sitting almost on top of each other.

What happens to an order that breaks the rule depends on *Distance filter mode*: it is **blocked** (default), its lot is **reduced** to fit, or the filter is **off**. A duplicate is always blocked. When the filter acts, a short message flashes in the bottom-left corner of the chart — that is the filter doing its job, not an error. Details on page 19.

05 · Five layers of brakes

No single setting protects an account. The Ninja gives you five layers; each catches what the previous one missed.

1 · Lot caps — a ceiling per order and for both sides together.

2 · Global stop loss — closes the whole basket at your loss number.

3 · Daily limits — a target and a max loss; when hit, the EA rests until tomorrow.

4 · News filter & schedule — no new cycles around big news or outside your hours.

5 · Safe close, CYCLE & remote — cut a small loss when things turn unsafe, land softly, or switch off from your phone.

WHICH BRAKE DOES WHAT

BRAKE	CLOSES OPEN ORDERS?	STOPS NEW CYCLES?	UNTIL WHEN
Lot caps	No	Blocks any order that would go over the cap	Always active while switched ON
Global stop loss	**Yes** — the whole basket	No — a fresh cycle may start	Acts instantly, every time the level is touched
Daily profit target / max loss	**Yes** — the whole basket	**Yes**, and no more averaging	The next server day
News filter · Trading schedule	No	**Yes** — open chains are still managed	The end of the news window / the next session
Safe close mode	**Yes** — only if the loss is still small	**Yes** — the EA switches itself off	Until you switch it back on (page 23)
CYCLE: OFF	No	**Yes** — open chains are still managed	Until you press CYCLE again, or the next server day
Remote OFF from your phone	No	**Yes** — the EA stops trading	Until you send the ON command (page 24)

! Out of the box, most brakes are disengaged

By default *Global stop loss* = 0, both daily limits = 0 and both lot caps are OFF. The EA ships this way so it never decides your risk for you — which means **you must set them yourself** before going live.

★ Layer the brakes, don't stack them

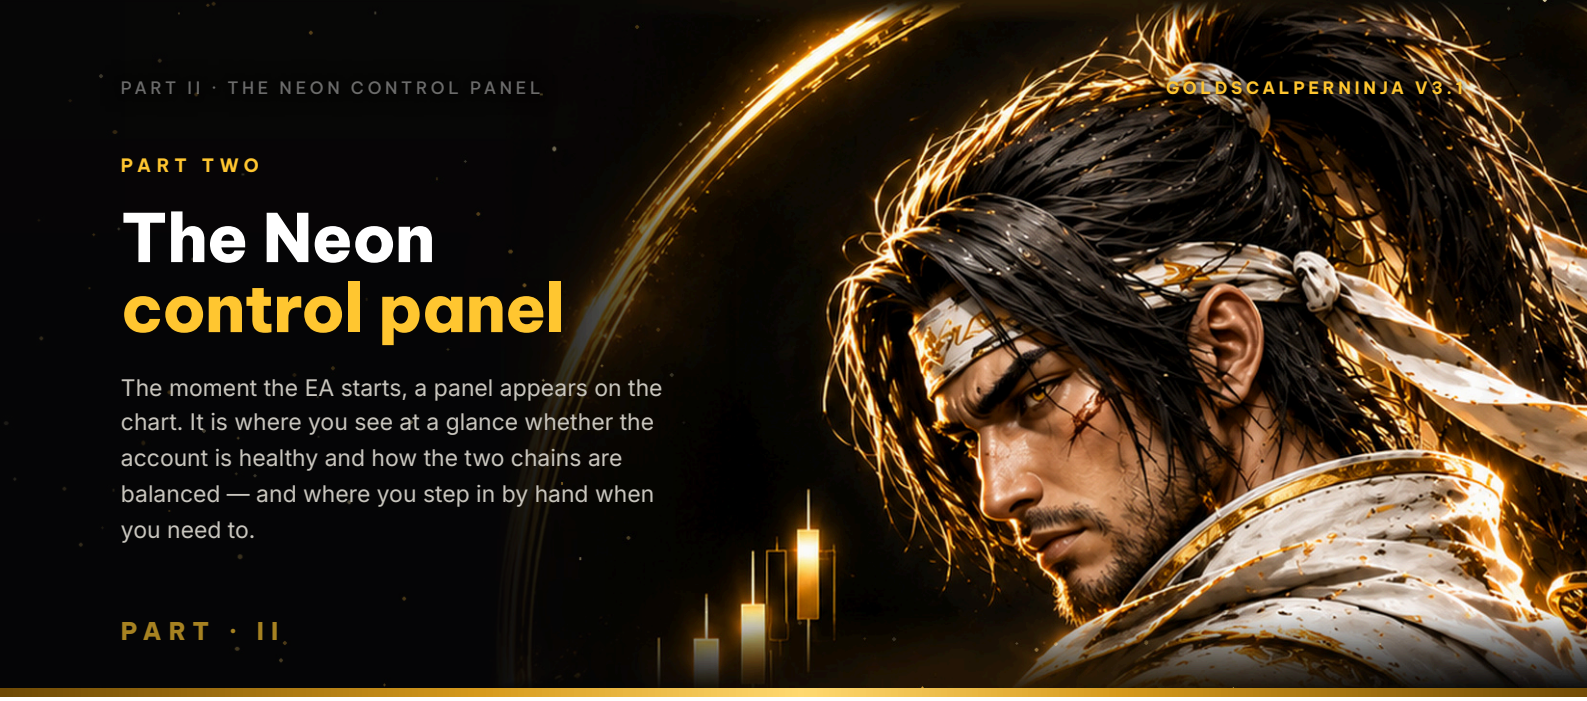

Set the **global stop loss smaller** than the **daily max loss**. The first cuts one bad basket and lets the EA start fresh; the second stops the whole day if a second bad basket follows.

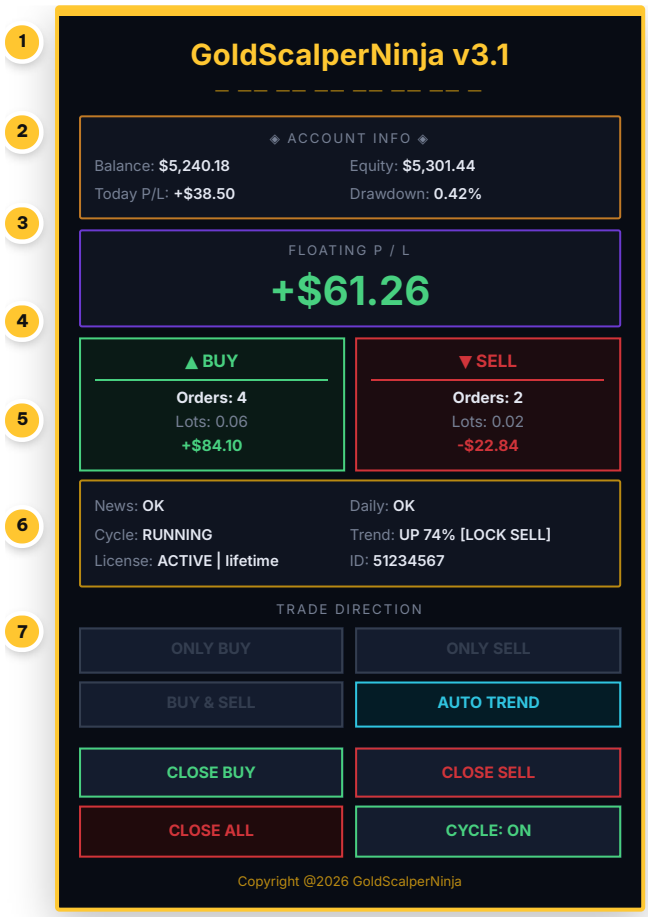

PART TWO

The Neon control panel

The moment the EA starts, a panel appears on the chart. It is where you see at a glance whether the account is healthy and how the two chains are balanced — and where you step in by hand when you need to.

PART · II

Simulation · panel width 384 screen pixels

1. **Header**
   Name and version. The borders of the account and P/L boxes glow through gold, amber and violet tones without pause.

2. **Account info**
   Balance and equity, *Today P/L* (profit this EA has closed today) and *Drawdown* (today's largest drop from the equity peak).

3. **Floating P/L**
   The open profit of BUY + SELL together — the very number compared with *Chain take profit*.

4. **BUY | SELL**
   Orders, lots and open profit of each chain.

5. **Status**
   News filter, daily limits, Cycle, Trend Master, license and your account ID.

6. **Trade direction**
   Four buttons that override *Trade direction mode* while the EA runs.

7. **Commands**
   Close a side, close everything, or switch the Cycle.

✓ The colours are its heartbeat

As long as the box borders keep changing colour, the EA is alive. If they freeze, the terminal or the EA is stuck — look at the *Experts* tab or restart your VPS.

i What belongs to whom

Balance, Equity and Drawdown describe the whole account. **Today P/L, Floating P/L and the BUY | SELL boxes** count only the orders with this chart's *Magic* and symbol. Values refresh about every 1.5 seconds.

LESSON 4

Reading every word on the panel

Every value on the panel has a colour that already tells you most of the story: **green** is normal or positive, **orange** asks for attention, **red** means something has been stopped or is losing.

ITEM	POSSIBLE VALUES	WHAT IT MEANS FOR YOU
ACCOUNT INFO		
Today P/L	`+$38.50` `-$12.00`	Profit and loss this EA has **closed** since the start of the server day (commission and swap included). Open orders are not counted here.
Drawdown	`under 5%` `5–10%` `10% or more`	The largest drop of equity from today's peak. Resets at the start of each server day.
STATUS		
News	`OFF` `OK` `ACTIVE`	OFF = filter disabled. OK = no high-impact news nearby. ACTIVE = inside a news window: no new cycles, open chains still managed.
Daily	`OK` `REACHED!` `SAFE CLOSED`	REACHED! = the daily target or daily max loss was hit; everything is closed until the next server day. SAFE CLOSED = Safe close mode cut the basket today.
Cycle	`RUNNING` `STOPPED`	STOPPED = no new chains will start (CYCLE: OFF). Matches the CYCLE button.
Trend	`UP 74% [LOCK SELL]` `SW 50%` `DOWN 0% [LOCK BUY]` `NO DATA`	Shown in Auto Trend mode. State (UP / SW = sideways / DOWN), position inside the Trend Master band, and the side that is locked after a confirmed trend.
License · ID	`ACTIVE | lifetime` `NOT REGISTERED` …	License state (full list on page 06) and your MT5 account number.

SIX PANEL PICTURES YOU WILL MEET

BUY red, SELL green, Trend `DOWN [LOCK BUY]`

A downtrend is confirmed. The BUY chain is trapped and may not add orders; SELL profits are used to clear BUY losers. Let it work — do not close the SELL side by hand.

News `ACTIVE` for hours

Normal on days with several high-impact USD releases. New cycles wait; open chains continue. Nothing is wrong.

Daily `REACHED!`

Your daily target or daily max loss has been hit. The basket was closed and the EA rests until the next server day.

Both chains empty, nothing happens

Check in order: Cycle, News, Daily, the schedule (server time), the license and the Trend row. One of the gates is closed — see page 28.

Drawdown turns red

Equity has dropped 10% or more from today's peak. A good moment for CYCLE: OFF and a calm review of your lot settings.

Floating P/L near the target, then it jumps

The basket reached *Chain take profit* and was closed. Lines vanish from the Trade tab and a new cycle begins if CYCLE is ON.

★ Several charts, several panels

Each chart has its own panel showing only its own orders. For the whole account, read *Equity* in the account box.

LESSON 5

Eight buttons & the signals on your chart

The buttons act **immediately** — there is no confirmation box. Read this page once before you ever click one on a real account.

TRADE DIRECTION · FOUR BUTTONS

BUTTON	WHAT HAPPENS WHEN YOU CLICK
ONLY BUY	Only BUY chains may start or add orders. **Pending SELL orders are cancelled at once.** Open SELL positions stay open, are still pruned and close with the basket — they just cannot grow.
ONLY SELL	The mirror image: only SELL chains; pending BUY orders are cancelled at once.
BUY & SELL	Both sides trade freely. Trend Master lines are still drawn and still guide cross-side pruning.
AUTO TREND	Trend Master decides which side may trade, as explained on page 09.

A button choice lasts until the EA is reloaded (settings changed, EA re-attached, terminal restarted). Then the EA returns to the *Trade direction mode* in your settings.

COMMANDS · FOUR BUTTONS

BUTTON	WHAT HAPPENS WHEN YOU CLICK
CLOSE BUY	Closes every BUY position and deletes every BUY pending order of this EA on this chart. The EA keeps retrying until the side is clean.
CLOSE SELL	The same for the SELL side. Pressing the other side's button while one is still closing turns the job into CLOSE ALL.
CLOSE ALL	Closes everything — positions, pending orders and virtual levels. While a close is running, no new order is opened.
CYCLE: ON / OFF	OFF = finish the current chains, start no new ones (open chains are still managed). **It switches back to ON by itself at the start of the next server day.** With *Safe close mode* ON, CYCLE: OFF can also trigger a safe close (page 23).

! Closing does not mean stopping

After CLOSE BUY, CLOSE SELL or CLOSE ALL, a new chain can start on the very next price tick if CYCLE is ON and all gates are open. If you want the EA to stay flat, press **CYCLE: OFF first**, then close.

SIGNALS DRAWN ON THE CHART

YOU SEE	IT MEANS
Green / red / dotted horizontal lines	TM Upper, TM Lower and TM Open D1 of Trend Master.
Small blue and red marks	The average open price of the BUY chain (blue) and of the SELL chain (red).
Comment `GoldScalperNinja BUY [CID=…]`	In the Trade tab: CID is the chain number the EA uses to recognise its chains after a restart. Do not edit it.

FLASHING LINE, BOTTOM-LEFT	IT MEANS
! DISTANCE FILTER ACTIVE	An order broke the Lot–Price ladder and was blocked or reduced.
! ANTI-DUPLICATE ACTIVE	An order was too close to an existing one of the same side.
! FRESH-CHAIN LOT GUARD	A new chain tried to start with a lot larger than allowed; it was reduced.
! OLD CHAIN ORDERS NOT CANCELLED YET	Leftover pending orders of a finished chain are still being removed; that side waits.

PART THREE

Every setting, in plain words

Press **F7** on the chart to open the settings window. This part walks through every line you can see there — group by group, in the same order as the window.

PART · III

MAP OF THE SETTINGS WINDOW

1	2	3	4–6	7–10
Order direction / trend filter Direction, entry mode, spacing, lots, caps · p.15–18	**Distance filter** The Lot–Price ladder · p.19	**Target, loss & trailing** Basket TP, global SL, trailing · p.20–21	**Advanced · Daily · News** Pruning switches, daily limits, news filter · p.22	**Safe close · Schedule · Remote · Panel** p.23–24

Group 1 is long, so this manual splits it into 1A (direction), 1B (entry & spacing) and 1C (lots & caps). In the settings window they are all under `=== ORDER DIRECTION / TREND FILTER ===`.

BEFORE GROUP 1

Identity · the Magic number

LABEL IN THE SETTINGS WINDOW	PLAIN-LANGUAGE EXPLANATION	DEFAULT
Magic	The identity card stamped on every order this EA opens. The EA only manages orders that carry **its own Magic on this chart's symbol**. Your manual trades (Magic 0) and other EAs are left alone. Running the EA on several charts? **Every chart needs a different Magic** — for example 888, 889, 890 — otherwise two copies treat each other's orders as their own. Write the list down.	888

Inputs · GoldScalperNinja EA v3.1

Variable	Value
Magic	888
=== ORDER DIRECTION / TREND FILTER ===	
Allow entries in trend direction	false
Trade direction mode	Auto Trend Master
Global permission to open BUY	true
...	

Load | Save | Reset

The words in this manual are the words in this window

Every setting in Part III is called by the text in the **Variable** column, exactly as the window shows it. The `=== GROUP ===` lines are group titles, not settings.

★ Save your configuration

The **Save** button writes all values to a `.set` file; **Load** brings them back on any chart. Keep one file per configuration you test.

GROUP ONE · A

Direction & trend filter

These four lines decide **which side** the EA may trade and whether a chain may also grow **with** the trend. They are the first lines under `=== ORDER DIRECTION / TREND FILTER ===`.

LABEL IN THE SETTINGS WINDOW	PLAIN-LANGUAGE EXPLANATION	DEFAULT
Allow entries in trend direction	Normally a chain only adds orders when price moves **against** it (averaging). When ON, it may also add an order when price moves **with** it — at least one *Grid step* beyond its best order (above the highest BUY, below the lowest SELL). That order takes the **next lot of the ladder**, so it is a bigger lot at a less favourable price. More profit in clean trends, a faster-growing chain when the trend turns.	`false`
Trade direction mode	The mode the EA starts with: **Only BUY**, **Only SELL**, **BUY & SELL** or **Auto Trend Master** (page 09). The four direction buttons on the panel can change it while the EA runs.	`Auto Trend Master`
Global permission to open BUY	A hard switch for the BUY side. When *false*, the EA never opens a BUY order on this chart — whatever the mode or the panel buttons say.	`true`
Global permission to open SELL	The same hard switch for the SELL side.	`true`

THREE GATES EVERY NEW ORDER PASSES, IN THIS ORDER

GATE 1 · A LOCK
Global permission
false = this side never trades. Nothing overrides it.

→

GATE 2 · YOUR CHOICE
Direction mode / panel button
Only BUY, Only SELL, BUY & SELL or Auto.

→

GATE 3 · AUTO ONLY
Trend Master
Blocks the side that fights the daily move.

→

THEN
Spacing, lots & filters
Grid step, lot ladder, distance filter, caps.

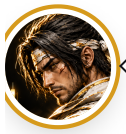

WHICH DIRECTION SETTING FITS WHICH SITUATION

YOUR SITUATION	SUGGESTED SETTING	WHY
Normal days, no strong opinion	`Auto Trend Master`	The EA avoids fighting a strong daily move from both sides.
Calm, range-bound market	`BUY & SELL`	Both chains collect the swings; pruning uses the edges of the band.
Firm, tested view on direction	`Only BUY` / `Only SELL`	Only for experienced users — there is no opposite chain to balance profit.
A side must never trade on this account	Global permission = **false**	The panel buttons cannot override it.

✓ Recommended start
Trade direction mode = Auto Trend Master, *Allow entries in trend direction* = false, both permissions = true.

i Mode vs. permission
The mode is a preference you can change from the panel. The two permission switches are locks that nothing on the panel can open.

! One side is a bet
With Only BUY or Only SELL, a wrong view on direction has no opposite chain to soften it — only your brakes protect the account.

BEFORE YOU CHANGE DIRECTION BY HAND
Clicking ONLY BUY or ONLY SELL on a busy day feels like taking control. Ask first: **do I know something the daily chart does not?** If not, leave the compass in charge.

GROUP ONE · B

Entry mode & grid spacing

These lines decide **how** the EA enters and **how far apart** its orders are. Together with the lot ladder on the next page, they set your depth of tolerance (page 05).

LABEL IN THE SETTINGS WINDOW	PLAIN-LANGUAGE EXPLANATION	DEFAULT
Entry mode	**Stop orders**, **StopLimit orders** or **Virtual stop (VPO)** — where the waiting order lives. Compared on page 07.	`Stop orders`
First grid step (points)	Distance from price for the **first** stop order of a new chain. Smaller = earlier entry and more false starts; larger = waits for a clearer move.	`40`
Minimum distance between orders (points)	For every later order: how far from price the stop order waits — in other words, how big a **rebound** price must make before an averaging order fills.	`50`
Grid step (points)	The minimum gap between a new averaging order and the **worst open order** of the same side. This is the main spacing of your grid — and the default distance of the Distance filter.	`50`
Min distance after MaxTrade (points)	Replaces *Minimum distance between orders* once a side holds more orders than the threshold below.	`50`
Grid step after MaxTrade (points)	Replaces *Grid step* once a side holds more orders than the threshold. Set it **larger** to give the deep part of a chain more room.	`50`
Threshold before switching to Step1	The number of open orders on a side after which the two “after MaxTrade” values take over. With 5, a side that already holds 6 orders uses the wider values for every new order.	`5`
Trail pending orders by price (points)	How far price may run away before a waiting stop order is moved after it. Smaller = tighter tracking and more modify requests. The order only ever moves in the favourable direction.	`40`
Orders per grid level	Reserved — it has no effect in version 3.1. Keep it at 1.	`1`
LISTED FURTHER DOWN, AFTER THE LOT CAPS		
Enable aggressive mode	Lets a side keep a second stop order when price has travelled far from the first one, re-centres stop orders left far behind by fast moves, and places entries more often. Faster recovery — and faster exposure. Leave OFF unless tested on Demo.	`false`
Deviation for virtual stop DEAL	Only for Virtual stop mode: the largest slippage in points accepted when a virtual level fires a market order. On market-execution accounts the broker fills at the available price anyway.	`5`

! The default spacing is scalper-tight

40–50 points is only about 0.40–0.50 USD of gold. With the default lot ladder, a 15 USD move can stack 30 orders. Widen the steps before a real account (page 26).

✓ A two-speed grid

For example: *Grid step* 120, threshold 8, *Grid step after MaxTrade* 250. The first orders scalp quickly; the deep part of the chain gets room to breathe.

i Your broker's minimum distance

If a distance is smaller than the minimum stop distance your broker allows, the EA quietly uses the broker's minimum instead.

GROUP ONE · C

Lot sizing & lot caps

The lot ladder is the engine of recovery — and the main source of risk. Four lines build the ladder; four more put a ceiling on it.

How the next lot is calculated

Next lot = Initial lot × Exponential^{tier} + tier × Additive, where **tier** = orders already open on that side ÷ *Orders per tier*, rounded down. The result is rounded to your broker's lot step.

Example with defaults — the 9th BUY: 8 BUYs are open → tier = 8 ÷ 2 = 4 → 0.01 × 1.5^4 = 0.0506 → **0.05 lot**.

LABEL IN THE SETTINGS WINDOW	PLAIN-LANGUAGE EXPLANATION	DEFAULT
BUILDING THE LADDER		
Initial lot size	The lot of the first order of every chain — the base of the whole ladder.	`0.01`
Additive lot multiplier	A fixed amount added for each tier, on top of the multiplier result: with 0.01, tier 1 adds 0.01, tier 2 adds 0.02, and so on. With an exponential multiplier of 1.0 it gives a gentle, straight-line ladder (style E on the next page).	`0.0`
Exponential lot multiplier	Each new tier multiplies the base by this number. The strongest lever in the EA: a small change here makes a huge difference deep in the chain.	`1.5`
Orders per tier (lot step levels)	How many orders share the same lot before the next tier begins. 2 = the lot steps up every 2 orders; 3 = every 3 orders (much gentler).	`2`
PUTTING A CEILING ON IT		
Enable per-order lot cap	When ON, no single order may be larger than the next line. Deeper orders keep that lot instead of growing.	`false`
Max lot per single order	The per-order ceiling used when the switch above is ON.	`1.0`
Enable total lot cap	When ON, the EA refuses any new order — first order or averaging — that would push the open lots of BUY + SELL together above the next line.	`false`
Max total lot (both sides)	The total ceiling used when the switch above is ON.	`10.0`

! The multiplier is the most dangerous number

1.5 and 1.3 look close. With 2 orders per tier, 30 orders on one side add up to **17.50 lots** at 1.5 but **3.34 lots** at 1.3. Compare the styles on the next page before you touch this line.

✓ Always switch on the total lot cap

It is the last wall between a bad week and a margin call. Choose the number from the margin your account can carry — not from hope.

i What a cap does to recovery

Once lots stop growing, the breakeven moves toward price more slowly. That is the price of safety — wider spacing (page 16) compensates for it.

★ New chains always start small

The first order of a new chain is held to the *Initial lot size* — the only exception is the trend-flip catch-up order described on page 09.

GROUP ONE · C

Five lot styles, compared in numbers

Same first lot (0.01), five different ladders. Read the table from top to bottom and watch when each style "takes off". Values are the lot of that order on one side, rounded to a 0.01 lot step.

ORDER #	A · DEFAULT ×1.5 · every 2	B · FIRM ×1.3 · every 2	C · BALANCED ×1.3 · every 3	D · GENTLE ×1.2 · every 3	E · STRAIGHT LINE ×1.0 · +0.01 · every 2
1	0.01	0.01	0.01	0.01	0.01
3	0.02	0.01	0.01	0.01	0.02
5	0.02	0.02	0.01	0.01	0.03
8	0.03	0.02	0.02	0.01	0.04
10	0.05	0.03	0.02	0.02	0.05
12	0.08	0.04	0.02	0.02	0.06
15	0.17	0.06	0.03	0.02	0.08
20	0.38	0.11	0.05	0.03	0.10
25	1.30	0.23	0.08	0.04	0.13
30	2.92	0.39	0.11	0.05	0.15
TOTAL OPEN LOT ON ONE SIDE					
after 10 orders	0.26	0.18	0.14	0.11	0.30
after 20 orders	2.26	0.86	0.49	0.36	1.10
after 30 orders	17.50	3.34	1.29	0.78	2.40
USD per 1 USD move*	≈ 1,750	≈ 334	≈ 129	≈ 78	≈ 240

* Value of a 1.00 USD gold move with 30 orders open, on a standard 100-ounce contract. Check the contract size of your broker's gold symbol.

i The first ten orders hide the truth

At order 10 every style looks harmless: 0.11 to 0.30 lots in total. The real difference only appears after order 20 — and at order 30, style A carries more than **twenty times** the lots of style D.

★ The straight line starts heavy, stays tame

Style E holds the most lots after 10 orders but less than B after 30. It suits accounts that prefer steady pressure over explosive recovery.

✓ Which one to pick first?

Begin on Demo with **C** or **D**. Move to **B** only after a month of data. Use **A** only with both lot caps ON and much wider steps.

A NINJA NEVER DRAWS THE SWORD FIRST

A faster ladder brings baskets home sooner on normal days — that is why it looks attractive. But you do not choose a ladder for normal days. You choose it for **the worst week of the year**. Ask yourself one question: "If this chain reaches 30 orders, can my account still breathe?"

GROUP TWO

Distance filter

Two lines under `=== DISTANCE FILTER ===` control the Lot–Price ladder introduced on page 10. The filter looks at **every** order of the same side — open positions, pending orders and virtual levels — before a new order is allowed.

LABEL IN THE SETTINGS WINDOW	PLAIN-LANGUAGE EXPLANATION	DEFAULT
Distance filter mode	**Off** — no ladder check and no duplicate check. Not recommended. **Reduce lot to fit the ladder** — an order that breaks the ladder is sent with the largest lot that still fits (rounded down). If not even the minimum lot fits, it is blocked. **Block the order** — an order that breaks the ladder is not sent. The EA tries again at the next suitable price.	`Block the order`
Filter distance in points (0 = use side Step)	The distance both checks use. **0** = use the *Grid step* of that side (or *Grid step after MaxTrade* once the threshold is passed). It is never smaller than your broker's minimum stop distance.	`0`

THE TWO RULES THE FILTER ENFORCES

Rule 1 · The ladder

A **bigger** lot must sit at least the filter distance **better** than every smaller order of its side — lower for BUY, higher for SELL. Equal or smaller lots may sit anywhere.

Rule 2 · No duplicates

No two orders of the same side may be closer than the filter distance. A duplicate is blocked in both *Block* and *Reduce lot* mode, because a smaller lot cannot fix a duplicate price.

THREE EXAMPLES · BUY CHAIN HOLDS 0.01 @ 3,350.00 AND 0.02 @ 3,349.50 · FILTER DISTANCE 50 POINTS

NEW ORDER WANTED	BLOCK THE ORDER	REDUCE LOT TO FIT	WHY
0.03 @ 3,349.00	`sent`	`sent 0.03`	Bigger lot, 0.50 lower than the 0.02 — the ladder is respected.
0.03 @ 3,350.60	`blocked`	`sent 0.01`	A bigger lot above both orders breaks the ladder. Only a lot no larger than the smallest order it fails to beat (0.01) fits.
0.03 @ 3,349.30	`blocked`	`blocked`	Only 0.20 away from the 0.02 order — a duplicate.

✓ Keep “Block the order”

It keeps the cleanest ladder: no order is ever bigger at a worse price. The EA simply waits for a better level.

i Trend-direction orders

Orders added **with** the trend (*Allow entries in trend direction*) are only checked for duplicates — by design they are bigger lots placed beyond the best order of the chain, which the ladder would otherwise always refuse.

★ Leave the distance at 0

With 0, the filter follows your grid automatically. A fixed value larger than your *Grid step* makes the filter block far more often than you intend.

GROUP THREE · A

Basket take profit & global stop loss

The group `=== TARGET LOSS & TRAILING MANAGEMENT ===` holds the two most important exits of the EA: the basket take profit that ends every good cycle, and the global stop loss that ends a bad one.

LABEL IN THE SETTINGS WINDOW	PLAIN-LANGUAGE EXPLANATION	DEFAULT
Chain take profit ($)	When the open profit of **BUY + SELL together** (swap included) reaches this amount, every position and pending order of this EA is closed and a new cycle begins if CYCLE is ON. This is the main exit of the EA — it keeps working outside your trading hours too.	10.0
Single-order take profit ($)	**Inactive in version 3.1** — changing it has no effect. Baskets close through *Chain take profit*.	50.0
Global stop loss BUY+SELL ($, 0 = off)	When the open loss of BUY + SELL together reaches this amount, the whole basket is closed. Type a **positive** number: 150 means "cut at −150 USD". **0 = off.** After the cut, a fresh cycle may start.	0.0

SIZING THE TAKE PROFIT · A PRACTICAL SCALE

INITIAL LOT SIZE	QUICK BASKETS	STANDARD	PATIENT	GOLD MOVE THAT EQUALS 10 USD ON ONE FIRST ORDER
0.01	3 USD	6 USD	10 USD	≈ 10.00 USD of price
0.02	6 USD	12 USD	20 USD	≈ 5.00 USD of price
0.05	15 USD	30 USD	50 USD	≈ 2.00 USD of price

On a standard 100-ounce contract, 0.01 lot earns about 1 USD per 1.00 USD of gold price. Chains with several orders reach the same target with a much smaller move.

SIZING THE GLOBAL STOP LOSS

Start from your Demo data

Write down the deepest floating loss your configuration reached on Demo. The global stop loss must sit **beyond** that number — otherwise ordinary swings will be cut into real losses.

Then compare it with your balance

Ask what share of the account one bad basket may cost. Many traders choose between **3% and 8%**. If your Demo depth is larger than that, the configuration is too aggressive for the account — change the lots or the spacing, not the stop.

FIVE WAYS A BASKET CAN END

Chain take profit

The normal, happy ending — the whole basket closes in profit.

Pruning to zero

Pruning closes the last old losers and the chain simply runs out.

Global stop loss

The basket's open loss hits your number. A fresh cycle may follow.

Daily limit · safe close

A daily target, daily max loss or safe close closes everything.

Your hand

CLOSE BUY, CLOSE SELL or CLOSE ALL on the panel.

! Never leave it at 0 on a real account

With 0, the only thing that can end a losing basket is your daily max loss — or the broker's margin call.

i What about commission?

The take profit counts profit and swap. If your broker charges commission per lot, set the target high enough to leave a real profit after it.

★ Floating vs. daily

The global stop loss looks only at **open** loss. The daily max loss (page 22) looks at **closed + open**. Together they form two different brakes.

GROUP THREE · B

Trailing tools

The rest of group 3 places real stop-loss and take-profit levels on your orders at the broker. All of them are **off by default**. They protect profit in clean moves, but in a grid they also remove orders that pruning could have used — so switch them on with care.

LABEL IN THE SETTINGS WINDOW	PLAIN-LANGUAGE EXPLANATION	DEFAULT
Trailing mode	**0** = off · **1** = candle: the SL follows the low (BUY) or high (SELL) of recent candles · **2** = fractal: the SL follows the latest fractal · **any number above 2** = a fixed distance in points behind price (300 = 3.00 USD). The SL is applied to every order of a side, based on that side's average price.	0
Trailing step (points)	The minimum improvement before the SL is moved again. Fewer modify requests to the broker.	0
Min profit to start trailing (points)	The SL is never placed closer than this many points beyond the side's **average open price** — so once trailing starts, the whole side has at least this much locked in.	0
TP distance for first order per side (points)	Places a broker TP on the **oldest** open order of each side, this many points from its open price. Handy for a quick scalp while a chain still has only one order. 0 = off.	0
Trailing timeframe (minutes; 0=chart TF)	The timeframe used by candle and fractal trailing: 1, 5, 15, 30, 60, 240, 1440… Values in between are rounded up to the next standard timeframe. 0 = the chart's own timeframe.	0
Activate global SL move	The trigger for a side-wide stop: the side's open profit divided by its lots, in **USD per 1.00 lot**. Example: the BUY side holds 0.10 lot and shows +30 USD → 300 per lot. When the value is reached, the next line takes effect. 0 = off.	0
Global SL move distance (points)	Once triggered, the SL of every order on that side is placed this many points behind current price and only ever moves forward. Both this line and the one above must be above 0.	0

EXAMPLE · FIXED-DISTANCE TRAILING

SETTING	BUY SIDE	SL PLACED	PRICE 3,346.00	PULLBACK
Trailing mode 300 Min profit 100 · step 50	**Average 3,340.00** price rises to 3,345.00	**3,342.00** 3.00 behind price, above 3,341.00	**SL → 3,343.00** moved: improvement ≥ 0.50	**Closed at 3,343.00** the whole side banks ≈ 3.00 per oz

! Tight trailing starves pruning

Every order closed by a trailing SL is an order that can no longer pay off old losers. If you use trailing, keep it wide — 300 points or more.

✓ First month: leave group 3B off

Let *Chain take profit* and pruning do the work until you know how your configuration behaves.

i These levels live at the broker

SL and TP set by these tools sit on the broker's server, so they still work if your terminal disconnects.

GROUPS FOUR · FIVE · SIX

Pruning switches, daily limits & news filter

GROUP 4 · `=== ADVANCED MODE ===`

LABEL IN THE SETTINGS WINDOW	PLAIN-LANGUAGE EXPLANATION	DEFAULT
Enable sequence pruning	The master switch for pruning (page 08): sequence pruning inside each side and the trend clean-up. When *false*, the EA does **no pruning at all** — cross-side pruning included.	`true`
Enable cross-side pruning	Lets winners of one side pay off the worst loser of the other side when price sits in the top or bottom zone of the Trend Master band. When *false*, each side prunes itself; the trend clean-up still runs in a confirmed trend.	`true`

GROUP 5 · `=== DAILY LIMITS ===`

LABEL IN THE SETTINGS WINDOW	PLAIN-LANGUAGE EXPLANATION	DEFAULT
Daily profit target $ (0=off)	When **today's closed profit + current open profit** reaches this amount, everything is closed and the EA rests for the rest of the server day — no new cycles, no averaging. The panel shows `Daily: REACHED!`	`0`
Daily max loss $ (0=off)	When today's closed + open result falls to minus this amount, the same happens: close everything, rest until the next server day. Type a positive number: 100 means "stop at −100 USD".	`0`

"Today" starts when the new daily candle opens on your broker's server and counts only this EA's orders on this chart.

GROUP 6 · `=== NEWS FILTER SETTINGS ===`

LABEL IN THE SETTINGS WINDOW	PLAIN-LANGUAGE EXPLANATION	DEFAULT
Enable news filter	Reads MT5's built-in economic calendar for **high-impact** events in USD (and the symbol's currencies) during the next 24 hours. A protective window opens around each release: **no new cycles** start, while open chains are still managed. The panel shows `News: ACTIVE`.	`true`

A DAY WITH *DAILY MAX LOSS* = 100 USD

SERVER TIME	CLOSED TODAY	OPEN BASKET	DAY TOTAL	WHAT THE EA DOES
10:00	+40	-30	+10	Keeps trading normally
14:00	+40	-120	-80	Still above −100 — keeps managing the chain
15:30	+40	-140	-100	**Limit hit:** closes everything, panel shows `REACHED!`, rests
00:00 next day	0	–	0	New server day: limits reset, a new cycle may start

i The daily target looks at the whole day

Example: you closed +120 USD today, the target is 100 USD and the open basket shows −15 USD. The day is at +105 USD, so the target is reached: the basket is closed at −15 and the day ends at +105. That is the target working as designed.

! News blocks new cycles, not open chains

A chain that is already open when the news hits can still add orders during the spike. That is what the global stop loss and daily max loss are for — or use *Safe close mode* (next page).

✓ Recommended

Both pruning switches ON, news filter ON, and a **daily max loss always set**. A daily target of 1–3% of the balance is plenty for most accounts.

★ Busy news days are quiet days

On days with several US releases the windows can join up and keep the EA idle for hours. The calendar only works in a live terminal — not in the Strategy Tester.

GROUPS SEVEN · EIGHT

Safe close & trading schedule

GROUP 7 · `=== SAFE CLOSE SETTINGS ===`

LABEL IN THE SETTINGS WINDOW	PLAIN-LANGUAGE EXPLANATION	DEFAULT
Enable safe close mode	When ON, the EA watches three "unsafe" conditions: **outside your trading hours**, **inside a news window**, or **CYCLE: OFF**. While any of them is true it stands still — no new orders, no averaging, no pruning or trailing (basket take profit and daily limits keep working). If the basket is losing but the loss is still **smaller** than the limit below, it closes everything, switches CYCLE off and switches **itself OFF**.	`false`
Max allowed floating loss to cut ($, negative)	The deepest loss safe close may cut. With −200: a basket at −150 is cut; a basket at −300 is **not** cut — the EA avoids selling the bottom of a deep move and keeps holding. A positive number is read as negative.	`-200`

SAFE CLOSE ON · LIMIT −200	BASKET NOW	WHAT HAPPENS
Session ends	`+25`	No cut. The EA stands still until the next session; the basket can still close at its target.
News window opens	`-60`	**Cut at −60.** Cycle OFF, the EA switches itself OFF.
You press CYCLE: OFF	`-350`	Deeper than −200: **no cut**. The EA holds and stands still.

! After a safe close, the EA stays switched off

The panel shows `Daily: SAFE CLOSED` and nothing new will open — even on the next day. To resume, send the remote **ON** command (a Buy Limit at price 999, page 24) or remove the EA from the chart and attach it again. Safe close acts at most once per server day.

GROUP 8 · `=== TRADING SCHEDULE (SERVER TIME) ===`

LABEL IN THE SETTINGS WINDOW	PLAIN-LANGUAGE EXPLANATION	DEFAULT
Note_Time · Note_Time2 · Note_Time3	Reminder lines only — they show the format. Changing them does nothing.	`text`
Enable trading on Monday … Sunday	One switch per day, each under its own `--- Monday ---` header. *false* = no new cycles on that day.	`true`
Session 1	The hours new cycles may start, as `HH:MM-HH:MM` in **broker server time** (the clock in Market Watch). Overnight sessions such as `22:00-03:00` are allowed.	`00:00-23:59`
Session 2 · Session 3 · Session 4	Extra windows for the same day. Leave blank if unused.	`blank`

Outside your sessions no new cycle starts, but open chains keep being managed — they can still add orders, be pruned and close at the basket target.

SCHEDULE IDEAS

GOAL	EXAMPLE	WHY
Skip the daily rollover	Session 1 = `01:05-23:40`	Many brokers widen spreads around server midnight.
No new cycles before the weekend	Friday Session 1 = `00:00-20:00`	Avoids carrying a young chain through a weekend gap.
Only the busiest hours	Session 1 = `09:00-12:00`, Session 2 = `15:00-19:00`	Adjust to your broker's server clock first.

GROUPS NINE · TEN

Remote control & panel position

GROUP 9 · `=== REMOTE CONTROL ===`

LABEL IN THE SETTINGS WINDOW	PLAIN-LANGUAGE EXPLANATION	DEFAULT
Remote_1	Reminder: *Turn OFF bot: Sell Stop at magic price (default 999)*. Text only.	`text`
Remote_2	Reminder: *Turn ON bot: Buy Limit at magic price (default 999)*. Text only.	`text`

SWITCHING THE EA OFF OR ON FROM YOUR PHONE

1. **Open the MT5 app**
   Log in to the **same trading account** the EA runs on.
2. **Create a pending order on XAUUSD**
   `Sell Stop` = turn OFF · `Buy Limit` = turn ON
3. **Price 999 · smallest volume**
   Leave SL and TP empty, then place the order.
4. **Done within about a second**
   The EA recognises the command, deletes the order itself and shows a confirmation pop-up on the terminal.

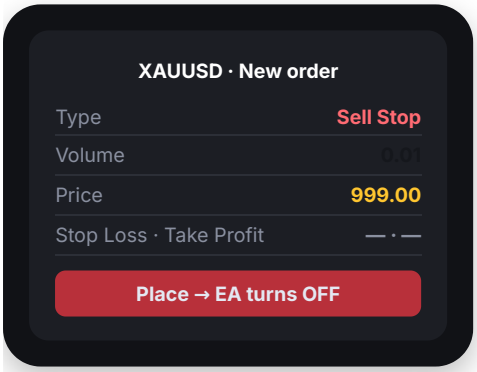

i What OFF does — and does not do

Does: stops new orders, averaging, pruning and trailing.

Does not: close your open positions. The basket still closes at *Chain take profit*, the daily limits still apply, and the panel and its buttons keep working.

★ Any sell or buy type works

Any SELL pending order at 999 (Stop, Limit or Stop Limit) means OFF; any BUY pending order at 999 means ON. It must be placed by you, not by an EA with the same Magic.

The same ticket with type `Buy Limit` at 999.00 turns the EA back ON.

Price 999 sits far away from gold, so the command order can never fill by accident — and the EA deletes it within about a second anyway.

! OFF is a full pause, not a soft landing

While OFF, an open chain is neither pruned nor averaged. For a soft landing at the desk use **CYCLE: OFF** on the panel; use remote OFF when you must stop the EA right now and cannot reach the terminal.

GROUP 10 · `=== PANEL SETTINGS ===`

LABEL IN THE SETTINGS WINDOW	PLAIN-LANGUAGE EXPLANATION	DEFAULT
Panel X position	Distance in screen pixels from the **left** edge of the chart. The panel is 384 pixels wide, so 1090 needs a chart at least about 1,480 pixels wide. On a laptop use **10** (left side) — or any **negative number**, such as −1, to dock the panel to the right edge automatically.	1090
Panel Y position	Distance in pixels from the top of the chart.	25

✓ Can't see the panel?

It is almost always off-screen. Press F7, set *Panel X position* to −1 and press OK — the panel moves to the right edge of whatever screen you have.

PART FOUR

Five golden rules of capital

The EA only executes. Whether your account lives long is decided not by a line of code, but by the five rules below.

PART · IV

I

Demo first, real money later

At least **four weeks** on Demo, and at least one of them with big US news (NFP, CPI, a Fed decision). Write down the deepest floating loss — that number, not the weekly profit, tells you how much capital the configuration really needs.

II

The first lot decides survival

Everything in the chain grows from the *Initial lot size*. Your real position size is **first lot × ladder**, not the first lot alone. With a small account a small first lot buys depth; vanity lot sizes buy margin calls.

III

A machine that never sleeps

The EA must run 24/7. Home PCs sleep, update and lose power; a VPS close to your broker does not. With *Virtual stop* mode, a VPS is not optional.

IV

Do not interrupt before you understand the grid

Every click on `CLOSE BUY` or `CLOSE SELL` realises the loss the chain was built to recover. More accounts die of panic-clicking than of the EA itself.

V

Know when enough is enough — set a daily target, set a daily max loss, then walk away

Bad days are certain; only their size is up to you. Set *Daily profit target* and *Daily max loss* before you go live and respect them when they trigger. A basket cut early by your brake is a lesson. An account frozen by a margin call is the end of the story.

AND THE RULE ABOVE ALL FIVE

Never deposit more money to rescue a losing chain. That is how a small-loss account becomes a large-loss account. **Adding funds only delays the verdict — it never changes it.**

4 weeks	24 / 7	2 limits	0 USD
of Demo before real money	VPS, never a sleeping PC	daily target & max loss set	added to rescue a chain

A good automated system is not one that never loses.
It is one that loses only in the way you planned for.

STARTING POINTS TO OBSERVE — NOT CONFIGURATIONS THAT GUARANTEE PROFIT

Three starting configurations for Demo

Run all three side by side on Demo accounts for four weeks, then decide for your own account. Values assume a **2,000 USD balance** and gold quoted with **two decimals**. Settings not listed stay at their defaults.

LABEL IN THE SETTINGS WINDOW	CONSERVATIVE	BALANCED	ACTIVE
DIRECTION & ENTRY			
Trade direction mode	Auto Trend Master	Auto Trend Master	BUY & SELL
Entry mode	Stop orders	Stop orders	Stop orders
First grid step / Minimum distance	60 / 80	50 / 60	40 / 50
Grid step	200	120	60
Threshold before switching to Step1	6	8	10
Min distance / Grid step after MaxTrade	120 / 400	80 / 250	60 / 120
LOTS & CAPS			
Initial lot size	0.01	0.01	0.02
Exponential lot multiplier / Orders per tier	1.2 / 3	1.3 / 3	1.3 / 2
Per-order lot cap	ON · 0.10	ON · 0.20	ON · 0.50
Total lot cap (both sides)	ON · 1.00	ON · 2.00	ON · 4.00
Distance filter mode	Block the order	Block the order	Reduce lot
EXITS & BRAKES (USD)			
Chain take profit	3	6	12
Global stop loss	80 · 4%	160 · 8%	300 · 15%
Daily profit target	30 · 1.5%	60 · 3%	100 · 5%
Daily max loss	120 · 6%	240 · 12%	400 · 20%
News filter · Pruning switches · Trailing mode	ON · ON · 0	ON · ON · 0	ON · ON · 0
WHAT IT ADDS UP TO · ONE SIDE, 30 ORDERS, BEFORE CAPS			
Depth of tolerance	≈ 104 USD	≈ 62 USD	≈ 29 USD
Total open lot	0.78	1.29	6.72 → capped 4.00
Overall	**SAFE START**	**BALANCED**	**EXPERIENCED ONLY**

✓ If you only pick one column

Pick **Conservative**. It is slow, but it gives you the time to understand what the EA is doing before your money depends on it.

i Scaling to your balance

Scale lots and USD amounts with your balance (10,000 USD → ×5). Keep the point values: they follow gold's volatility, not your account size.

! Active is not for small accounts

Its total lot cap is what keeps it alive in a long move. Never run it with the caps switched off.

FINAL LESSON

A 30-day roadmap for newcomers

Week 1 · Observe

Run Demo with the **Conservative** column. Do not touch anything. Every day at the same time, note the deepest floating loss, the total lot, the drawdown and the Cycle state.

Week 2 · Read the panel

For every chain, note how deep it went, when pruning happened and how much the total lot shrank after it. Press every panel button **on Demo** to learn what it does.

Week 3 · Change one thing

Change **one** setting compared with week 2 — the *Grid step* or the multiplier. Change several at once and you will never know which one made the difference.

Week 4 · Stress test

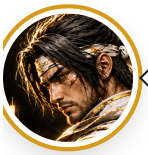

Run through a week with major US news. If the Demo account comes through with a deepest loss you can truly accept, you are ready.

YOUR DEMO JOURNAL · COPY THIS INTO A NOTEBOOK

DATE	DEEPEST FLOATING LOSS	LARGEST TOTAL LOT	DRAWDOWN (PANEL)	BASKETS CLOSED	NOTES

CHECKLIST BEFORE GOING LIVE

1. **I ran Demo for at least four weeks and wrote down the deepest floating loss**
   If that number is half of your real account or more, the configuration is not ready yet.
2. **I calculated depth and total lot for 30 orders and compared them with a volatile week**
   Lesson 2 on page 05. Gold can travel more than 100 USD in a week.
3. **I set *Daily profit target* and *Daily max loss* to real numbers**
   Not 0. This is the step most often skipped — and the most expensive one to skip.
4. **I switched on *Enable total lot cap* with a ceiling my margin can carry**
   It is the last wall between a bad week and a margin call.
5. **I set *Global stop loss* to a real number, smaller than the daily max loss**
   Two brakes, layered — page 10.
6. **Every chart has its own Magic, and I wrote the list down**
   Two copies with one Magic fight over the same orders.
7. **I pressed every panel button on Demo at least once**
   Including CYCLE: OFF followed by CLOSE ALL.
8. **My VPS runs 24/7, and I tested remote OFF and ON from my phone once**
   The rescue feature only helps if you used it before you need it.
9. **The panel is fully visible and the License row shows ACTIVE**
   If the panel is missing, set *Panel X position* to −1.
10. **I start the real account with a small Initial lot size**
    Demo is never identical: real spreads, slippage and execution differ.

IF YOU CAN TICK ALL TEN

you are ready to go live with a small lot. If you cannot, Demo is not wasting your time — **it is buying you time** that a real account would charge you for.

WHEN SOMETHING LOOKS WRONG

Troubleshooting · ten common situations

Nearly every “the EA is broken” message we receive has one of the causes below. Work down the list before contacting support — most fixes take less than a minute.

WHAT YOU SEE	MOST LIKELY CAUSE	WHAT TO DO
EA attached, no panel activity, no orders	Algo Trading is off, or *Allow Algo Trading* was not ticked when attaching.	Make the toolbar *Algo Trading* button green; press F7 → *Common* → tick *Allow Algo Trading*.
Panel alive, but no new chain starts	A gate is closed: Cycle STOPPED, News ACTIVE, Daily REACHED! / SAFE CLOSED, outside your sessions, total lot cap reached, or the EA was switched OFF remotely.	Read the status rows from top to bottom. The panel has no row for the remote switch — if all gates look open, send the remote **ON** command (Buy Limit at 999). It does no harm if the EA is already on.
Only one side ever trades	Auto mode with price in the upper or lower zone of Trend Master, an ONLY BUY / ONLY SELL button, or a global permission set to *false*.	Check the Trend row and the direction buttons; check both *Global permission* lines.
License: NOT REGISTERED	This account number is not registered yet.	Send the ID shown on the panel to **t.me/GoldScalperNinja**.
License: NETWORK ERROR	The two license addresses are not allowed in MT5.	Tools → Options → Expert Advisors → add `https://script.google.com` and `https://script.googleusercontent.com`.
Panel missing or cut off	*Panel X position* 1090 is wider than your screen.	F7 → *Panel X position* = −1 (docks right) or 10 (docks left).
“DISTANCE FILTER ACTIVE” flashes often	Normal now and then. Constant flashing usually means a fixed *Filter distance* larger than your *Grid step*.	Set *Filter distance in points* to 0 so it follows your grid.
Trend: NO DATA	MT5 has not downloaded enough daily candles.	Open an XAUUSD D1 chart once and scroll back a little.
After a safe close, nothing opens — even the next day	Safe close switches the EA OFF on purpose.	Send the remote ON command, or remove the EA from the chart and attach it again.
Stop orders rejected or never placed	The broker refuses stop-limit orders on gold, or its minimum stop distance is unusual.	Use *Entry mode* = Stop orders; check the *Journal* tab for the broker's exact message.

i After a VPS or terminal restart

The EA recognises its open chains again from the order comments and carries on. Virtual stop levels and the direction-button choice are rebuilt from your settings.

★ Two tabs that answer most questions

At the bottom of MT5, the *Experts* tab shows what the EA reports, and the *Journal* tab shows what the broker answered. Include both when you ask for help.

FINAL WORDS

The EA works day and night. The one responsible is still you.

FOUR MISTAKES THAT END ACCOUNTS FASTEST

THE MISTAKE	WHAT HAPPENS NEXT
Leaving the daily target and daily max loss at 0	The EA has no limit. One bad day can erase months of profit.
Raising the multiplier because the first ten orders look small	Lots grow exponentially. From order 20 onward they outgrow everything else.
Leaving Trend Master out to get more trades	Nothing stops a counter-trend chain from growing in a strong one-way move.
Depositing more to hold a losing chain	A small-loss account becomes a large-loss account. The verdict only arrives later.

`t.me/GoldScalperNinja`

When you ask for help, please attach **a screenshot of the panel**, **your settings file** (F7 → Inputs → Save) and the **Experts and Journal tabs**. The team can then answer in minutes instead of asking back and forth.

DISCLAIMER

Risk warning. Trading leveraged financial products carries a high level of risk and can lead to the loss of all your capital. The higher the leverage, the higher the risk. Only trade with money you can afford to lose.

Nature of this document. This manual describes how GoldScalperNinja v3.1 works. It is not investment advice, not an offer to buy or sell any product, and not a promise of any level of profit. All numbers, configurations and examples are illustrations for learning.

Past results. Results from Demo accounts, backtests or other people's accounts do not guarantee future results. Real trading conditions — spreads, slippage, liquidity gaps and execution — can differ greatly.

Grid and multi-lot systems. GoldScalperNinja trades with several orders and increasing lot sizes. This lets it ride normal swings, but in a strong one-way move the floating loss and the total lot can grow quickly. The protections described in this manual reduce this risk; they never remove it.

Your responsibility. You alone are responsible for your trading decisions, your settings and your capital management. The developers accept no liability for direct or indirect losses arising from the use of the software, including losses caused by internet outages, VPS or terminal failures, broker execution or configuration mistakes.
